

Scope and Cost

Organization Layer (Parent Companies)

Prepared for	Priyam Gupta
Prepared by	Mori
Date	18 August 2026
Reference	FleetFlow ERP, Change Request 001

1. Requirement

A level above the existing Companies registry. Multiple parent organizations in one database, each with its own administrators and its own child companies. Organizations cannot see each other.

2. Why this is separate from the current build

The system already isolates companies. Every record carries a company code, and a user only sees their own company.

What does not exist is a boundary above that. There is one flat list of companies and one kind of Admin who can see all of them. Giving each parent its own Admin changes the access control model, not the storage model.

3. Included

- Organization entity (parent company) with code, name and status
- Every company belongs to one organization
- New top level role, the only role able to create organizations and see across them
- Admins limited to the companies inside their own organization
- Company switcher, company list and user assignment limited to the admin's own organization
- Demo sandbox scoped per organization
- Database migration placing the 3 existing companies under one default organization
- Organizations admin screen
- Automated tests covering the isolation rules

4. Not included

- Self service signup for new organizations
- Per organization branding, domains or billing
- Moving an existing company between organizations
- Data migration between organizations

5. Effort

5 working days. The backend foundation is already built as of today: the data model, the access control layer and the isolation tests. The remaining work is the organization management screen, the platform administrator account, and end to end testing.

6. Cost

USD 600

7. Payment

Requested together with the outstanding MVP balance of USD 1,039.10. Total: USD 1,639.10

Work continues while this is confirmed. Delivery is not being held.
